dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatchogical, cytostatic, antiseborrheic, antidabetic, antisickling, obthhalmological, vulnerary, kratcholytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic rematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn is commissioned.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating proliferative skin or eye diseases and scarring, using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Seguence 19 BP; 4 A; 5 C; 4 G; 6 T; 0 other;

Kit for automated genotyping contg. pairs of PCR primers - designed

```
automated genotyping. esp. flugrescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and FCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 8 primer pairs are shown in AAQ95735-76. The published size range of the D1S310 allele is 249-261 bp, and the degree of heterozygosity in the population is about 71%.
                                                                                                                                                                                                                                                                                                                                                                             The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The MMS are polymorphic, simple sequence repeats and can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 4 A; 8 C; 3 G; 5 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                          This 5' primer corresponds to nucleotides 809-830 of the chicken matrix metalloproteinase-2 (chMMP-2) mature polypeptide coding region (see AAV03995). It was used with a 3' primer (see AAV03996) to amplify a portion of coding region encoding amino acids 274-637 of chMMP-2. The 5' primer was designed to incorporate a BamH1 site allowing directional ligation of the amplified product into pGEX-1lambdaT or pGEX-3X expression vectors. Recombinant chMMMP-2 (274-637) was expressed as a fusion protein with glutathione-5-transferase in B. coli transformants. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5' PCR primer used to obtain cDNA encoding chicken MMP-2 fragments.
                                                                                                                                                                                                                                                                                                                                          Transfer of the discovery that angiogenesis is mediated by the specific vitronectin receptor alpha-v beta-3, and that inhibition of alpha-v beta-3, and that inhibition of alpha-v beta-3 function inhibits angiogenesis. Claimed antagonists of alpha-v beta-3 include C-terminal fragments (see AAW41083-94) of human or chicken MMP-2 and fusion proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Metalloprotease-2; MMP-2; alpha-v-beta-5 antagonist; treatment; vitronectin receptor; inhibition; angiogenesis; tumour growth; restenosis; neovascularisation; PCR primer; ss.

primers Anytao's wate used, Cogether with Anytao's as the 2 protein fragments (AAW41234-39). Fragments of the MMP-2 protein act as alpha v-beta-5 antagonists. Alpha-v-beta-5 is a vitronectin receptor.

Inhibitors of alpha-v-beta-5 can inhibit angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis i.e. an alpha-v-beta-5 antagonising polyceptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of MMP-2. The antagonists are used to inhibit angiogenesis in inflamed tissue, in solid tumours or metastases, and in a wide range of ocular disorders (e.g. diabetic or other forms of retinopathy, necvascular calcular corresponding angiogenesis in inflamed regression or to inhibit growth of tumours. The alpha-v-beta-5 can also be used to treat restenosis caused by migration of selected tissues. The antagonists particularly inhibit oscillarisation where this is induced by cytokines, e.g. transforming correct alpha, epidermal growth factor or especially vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                   The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPB) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                         Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

AAT50138-T50359 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50136-T50346). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The clibozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibiting CETP, celiminated) thereby preventing the reduction in size density of the high consisty lipoproteins (HDL), prolonging HDL half life, and therefore associated with abnormal levels of CETP, specifically atherosclerosis, associated with abnormal levels of CETP, specifically atherosclerosis, cascociated with abnormal levels of CETP, specifically atherosclerosis, dyslupiadaemia, hyperbetalipoproteinaemia, hypoalphalipoproteinaemia, cuascular complications of diabetes, transplant, atherectomy and candidated and corresponding increase in HDL levels).

Candioplastic restenosis. By inhibiting CETP, the levels of HDL and low decrease in LDL levels, and a corresponding increase in HDL levels).

Chemical HT ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP man.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·

called macaca mulatta rhadinovirus 17577 (RRV). AAC64754 represents the RRV genome sequence, and AAB5123 to AAB5204 represent the proteins encoded by the genome sequence. The present invention also specifically claims the individual open reading frame (ORF) nucleotide sequences from the genome which encode the individual proteins, but these sequences from the genome which encode the individual proteins, but these sequences are not given. A non-human animal infected with RRV can be used for testing the efficacy of drug in the treatment of condition associated with infection with RRV such as Raposi's sarcoma, lymphoproliferative infection with RRV such as Raposi's sarcoma, lymphoproliferative disorders, B-cell hyperplasia, lymphademopathy, splenomegaly, hypergammaglobinulinaemia or autoimmune haemolytic anaemia by administering the drug to a immuno-compromised non-human primate model for a immuno-compromised non-human primate model for testing potential treatments for conditions associated with RRV infection. It is also useful for testing the subject with RRV infection by administering the vaccine to the subject capable of infection with RRV incoulating the subject with RRV and one of the subject of vaccine. AAC64755 to AAC64765 and AAB53205 to AAB53213 represent sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

angiotensian constraint of the particular constraint corpus and comparing the polymorphic pattern with that in patients with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI) hypertension, atherosclerosis or stroke. They can also be used to predict antagonists to treatments with ACE inhibitors, angiotensin II receptor antagonists, duretics, alpha-or beta-adrenergic receptor antagonists, etc. It is also used to identify susceptibility to cardiovascular disease. Libraries of mucleic acids containing polymorphic positions in the 3 genes, and libraries of targets corresponding to the peptides from the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of
                                                                                                                                                                                                                                           This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention. The method is for assessing cardiovascular status in humans by determining the sequence of at least one polymorphic site in the ACE (angiotensin converting enzyme), AGT (angiotensingen) and/or ATI (type 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                          of genes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human ACE, AGT and AT1 genes polymorphisms PCR primer SEQ ID NO: 38

Assessing disease status in individual by determining sequence(s) at one or more polymorphic positions within the human genes encoding the protein(s) involved in physiological pathway associated with treatment
                                                                                                                                                                                                                                                                      Example 1; Page 57; 141pp; English.
```

polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THe PCR primers shown in sequences AACG1201-C61371 were all used to demonstrate the The present invention is related to methods for determining the methods of the invention.

Norberg LT, Andersson MK,

Assessing cardiovascular status in humans involves comparing test polymorphic pattern comprising polymorphic positions within genes encoding specific proteins, with reference polymorphic pattern WPI; 2000-318010/27.

Lindstrom PHR, Jonsson L;

Example 1; Page 49; 126pp; English.

The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACB), angiotensin II receptor type 1 (ATI) and type 2 (ATI), angiotensinogen (AGT), renin, aldosterone synthase, endothelin receptor type A and beta-adrenergic

correspondence and 2. The method comprises determining the sequence at one pattern of polymorphic positions within these genes, and comparing the pattern of polymorphic positions within these genes, and comparing the pattern obtained from a population of individuals exhibiting a predetermined cardiovascular disease status. The polymorphic markers cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular diseases as myocardial infarction, unstable angina, therefore a morphic marker and stroke. They are also useful for predicting the likely cardiovascular status of a patient given a cardiovascular cardiovascular status of cardiovascular days. The predicting the likely cardiovascular status of cardiovascular days controlled to cardiovascular chance, blockers) or calcium channel blockers. One or more polymorphic markers blockers or calcium channel blockers. One or more polymorphic markers browings a basis for predicting the outcome of a treatment regimen. Fragments of the genes comprising a polymorphic site may be used as proteins they encode are useful in the screening of potential cardiovascular days. Determination of an individual spolymorphic cardiovascular days. Determination of an individual spolymorphic cardiovascular patient. It also provides the ability to eliminate brisis from a response, or a risk for an adverse response, to a particular cardiovascular patient. Trails who are predicted to cardiovascular patients from climical trials who are predicted to cardiovascular patients required for a particular of such sub-populations from the treatment group. Beneficial current decreases the duration and cost of such trials. Sequences the inturn decreases the duration and cost of such trials. Sequences the invention to amplify short fragments of the human Acadence determination. 0 The method comprises determining the sequence at one Gaps 0; 59.0%; Score 12.4; DB 21; Length 19; 92.9%; Pred. Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6551795

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION NUMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR PILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 13016

LENGTH: 771
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó.
